OS MARPAT 133:239738
 AB The invention relates to a method of prepg. surface-active **alcs.**
 and surface-active **alc.** ethers which are well suited for use as
 surface-active agents or for the prepn. of surface-active agents. To this
 end, **olefin mixts.** contg. a predominant share of
 branched dodecenes (prepd. from **olefin mixts.** contg.
 less than 30 % by wt. **linear** hexene isomers using a
 catalyst contg. nickel) are derivatized to form surface-active
alcs. which are then possibly alkoxylated. The invention also
 relates to the use of said surface-active **alcs.** and
 surface-active **alc.** ethers for the prepn. of surface-active
 agents by glycosidation or polyglycosidation, sulfation, or phosphorylation.
 In an example, a **mixt.** of of methylpentenes 71, hexenes 22, and
 dimethylbutenes 7% was **dimerized** over a catalyst contg. 50% NiO
 to give a dodecene **mixt.** which was then hydroformylated and
 reduced to give a **mixt.** of C13-primary **alcs.** The
alc. mixt. could then be ethoxylated, phosphated, or
 sulfated and the ethoxylate could also be sulfated or phosphated to give
surfactants.

AB The invention describes a process for the preparation of
surfactant alcohols and **surfactant**
alcohol ethers which are, inter alia, highly suitable as
surfactants or for the preparation of **surfactants**. The
process, starting from **olefin mixtures** which
comprise less than 30% by **weight** of **linear** hexene
isomers and utilizing a catalyst which contains **nickel**, prepares
olefin mixtures having a predominant fraction of
branched dodecenes, which are subsequently derivatized to give
surfactant alcohols and then optionally alkoxylated.

The invention further relates to the use of the **surfactant**
alcohols and **surfactant alcohol** ethers for
the preparation of **surfactants** by glycosidation or
polyglycosidation, sulfation or phosphorylation.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB A process is described for coproducing vinylidene **alcohol** and vinylidene olefin. The process involves **dimerizing** one or more vinylolefins with an alkyl aluminum catalyst to form a first product **mixture** comprising at least vinylidene olefin and alkyl aluminum compound. The vinylidene olefin is then reacted with the alkyl aluminum compound under displacement conditions to form 1-olefin while concurrently removing the 1-olefin from the displacement reaction **mixture** to form a second product **mixture** comprising at least beta-branched alkyl aluminum compound. The second product **mixture** is treated with air or oxygen under mild oxidation conditions to form a third product **mixture** comprising at least beta-branched aluminum alkoxide. The beta-branched aluminum alkoxide is then hydrolyzed to form vinylidene **alcohol**. The process makes effective use of the alkyl aluminum catalyst both as a catalyst and as a reactant, and requires only a relatively small amount of reaction equipment.
